(54) Title: COOKING DEVICE AND PROCEDURE

(57) Abstract: The cooking device (1) comprises a body (2) which carries a bowl (3) with electrical heating means (4) and containing a basket (5) for food. The basket is connected to drive means (6) suitable for moving it between a position inside the bowl and a position at least partially outside of it. The device also comprises a first sensor (7) of the temperature of at least a portion of the bowl and a timer (8) connected to means (9) for controlling the drive means, for moving the basket in relation to signals that the control means receives from the temperature sensor and from the timer. In the procedure for cooking through the indicated device the heating means heats the water contained in the bowl taking it up to a predetermined temperature, at which point the first sensor detects that such a predetermined temperature has been reached and the basket is lowered and, at the same time, the timer is started for a preset time period, at the end of which the control means deactivates the heating means and commands the removal of the basket from the bowl.
